

12.5-30GHz Low Noise Amplifier

GaAs Monolithic Microwave IC

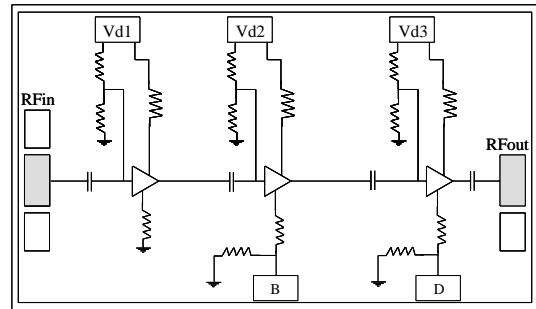

Description

The CHA3689-99F is a three-stage self biased wide band monolithic low noise amplifier.

It is designed for a wide range of applications, from military to commercial communication systems.

The circuit is manufactured with a pHEMT process, 0.25 μ m gate length, via holes through the substrate, air bridges and electron beam gate lithography.

It is available in chip form.

Main Features

- Broadband performance: 12.5-30GHz
- 2.0dB noise figure
- 26dB gain (12.5-26GHz)
- 26dBm output IP3 (18-30GHz)
- Low DC power consumption
- DC bias: Vd=4 Volt @ Id= 90 /120mA
- Chip size : 2.45 x 1.21 x 0.1mm

On wafer typical measurements @ 120mA

Mechanical data

DC Pads Size: 100/100 μm , Chip thickness: 100 μm
 Chip size: 2.45 x 1.21 x 0.1mm $\pm 35\mu\text{m}$
 All dimensions are in micrometers

Recommended assembly plan

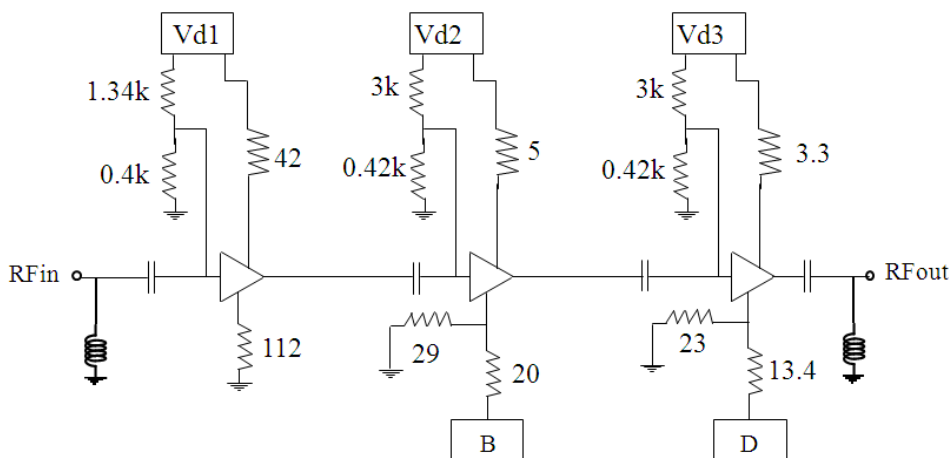

25µm wedge bonding is preferred

Note: Supply feed should be bypassed.

Chip Biasing options

This chip is self-biased, and flexibility is provided by the access to number of pads. The internal DC electrical schematic is given in order to use these pads in a safe way.

The requirement is not to exceed $V_{ds} = 3.5\text{Volt}$ (internal Drain to Source voltage).

We propose two standard biasings:

- Low Noise and low consumption: $V_d = 4\text{V}$ and B, D not connected (NC).
 $I_{dd} = 90\text{mA}$ & $P_{out-1\text{dB}} = 14\text{dBm}$ Typical
- Low Noise and higher output power: $V_d = 4\text{V}$ and B, D grounded.
 $I_{dd} = 120\text{mA}$ & $P_{out-1\text{dB}} = 15\text{dBm}$ Typical

Recommended ESD management

Refer to the application note AN0020 available at <http://www.ums-gaas.com> for ESD sensitivity and handling recommendations for the UMS products.
