

Product Overview

The CMD293 is a wideband medium power GaAs MMIC driver amplifier ideally suited for military, space and communications systems where small size and high linearity are needed. At 30 GHz the device delivers 20 dB of gain with a corresponding output 1 dB compression point of +26 dBm and noise figure of 6 dB. The CMD293 integrates a temperature compensated RF power detection circuit that enables power detection at 0.7 V/W at 30 GHz. The device is a 50 ohm matched design which eliminates the need for external DC blocks and RF port matching. The CMD293 offers full passivation for increased reliability and moisture protection.

Applications Information

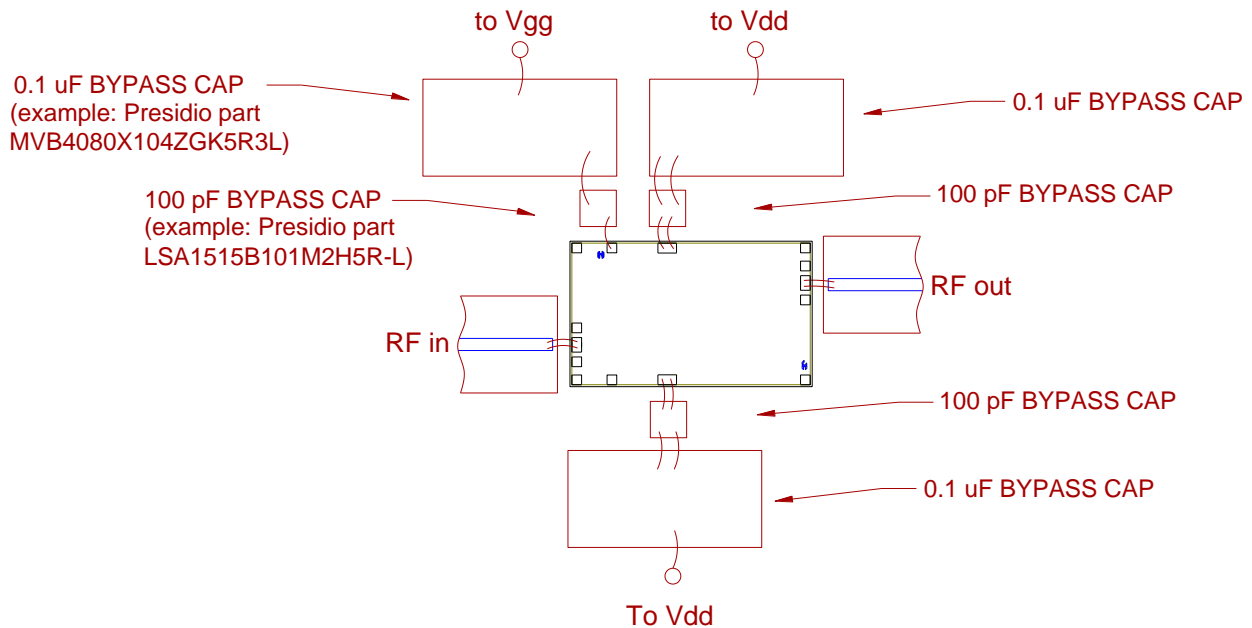

Assembly Guidelines

The backside of the CMD293 is RF ground. Die attach should be accomplished with electrically and thermally conductive epoxy or eutectic attach. Standard assembly procedures should be followed for high frequency devices. The top surface of the semiconductor should be made planar to the adjacent RF transmission lines, and the RF decoupling capacitors placed in close proximity to the DC connections on chip.

RF connections should be made as short as possible to reduce the inductive effect of the bond wire. Use of a 0.8 mil thermosonic wedge bonding is highly recommended as the loop height will be minimized. The RF input and output require a double bond wire as shown.

The semiconductor is 70 um thick and should be handled by the sides of the die or with a custom collet. Do not make contact directly with the die surface as this will damage the monolithic circuitry. Handle with care.

GaAs MMIC devices are susceptible to damage from Electrostatic Discharge. Proper precautions should be observed during handling, assembly and test.

Applications Information

Application Circuit

Biasing and Operation

The CMD293 is biased with a positive drain supply and a negative gate supply. Performance is optimized when the drain voltage is set to +5 V, though it may be set to as low as +3 V. The nominal gate voltage is -0.4 V.

Turn ON procedure:

1. Apply gate voltage V_{gg} and set to -2 V
2. Apply drain voltage V_{dd} and set to +5 V
3. Increase V_{gg} (less negative) to achieve a drain current of 480 mA

Turn OFF procedure:

1. Turn off drain voltage V_{dd}
2. Turn off gate voltage V_{gg}

RF power can be applied at any time.
